Site Audit: Issues

Subdomain: aurangabad.maharajaswa.com

Last Update: October 19, 2023

Crawled Pages: 4

aurangabad.maharajaswa.com

20

1 page returned a 4XX status code

About this issue: A 4xx error means that a webpage cannot be accessed. This is usually the result of broken links. These errors prevent users and search engine robots from accessing your webpages, and can negatively affect both user experience and search engine crawlability.

This will in turn lead to a drop in traffic driven to your website. Please be aware that crawler may detect a working link as broken if your website blocks our crawler from accessing it. This usually happens due to the following reasons: 1.

DDoS protection system. 2. Overloaded or misconfigured server.

How to fix: If a webpage returns an error, remove all links leading to the error page or replace it with another resource. To identify all pages on your website that contain links to a 4xx page, click "View broken links" next to the error page. If the links reported as 4xx do work when accessed with a browser, you can try either of the following: 1.

Contact your web hosting support team. 2. Instruct search engine robots not to crawl your website too frequently by specifying the "crawl-delay" directive in your robots.txt.

10

No redirect or canonical to HTTPS homepage from HTTP version

About this issue: If you're running both HTTP and HTTPS versions of your homepage, it is very important to make sure that their coexistence doesn't impede your SEO. Search engines are not able to figure out which page to index and which one to prioritize in search results. As a result, you may experience a lot of problems, including pages competing with each other, traffic loss and poor placement in search results.

To avoid these issues, you must instruct search engines to only index the HTTPS version. How to fix: Do either of the following: 1. Redirect your HTTP page to the HTTPS version via a 301 redirect.

2. Mark up your HTTPS version as the preferred one by adding a rel="canonical" to your HTTP pages.

0 pages have slow load speed

aurangabad.maharajaswa.com

10 0

1 page doesn't have an h1 heading

About this issue: While less important than <title> tags, h1 headings still help define your page's topic for search engines and users. If an <h1> tag is empty or missing, search engines may place your page lower than they would otherwise. Besides, a lack of an <h1> tag breaks your page's heading hierarchy, which is not SEO friendly.

How to fix: Provide a concise, relevant h1 heading for each of your page.

1 0

1 page doesn't have a meta description

About this issue: Though meta descriptions don't have a direct influence on rankings, they are used by search engines to display your page's description in search results. A good description helps users know what your page is about and encourages them to click on it. If your page's meta description tag is missing, search engines will usually display its first sentence, which may be irrelevant and unappealing to users.

For more information, please see these article: Create good titles and snippets in Search Results: <https://support.google.com/webmasters/answer/35624>. How to fix: In order to gain a higher click-through rate, you should ensure that all of your webpages have meta descriptions that contain relevant keywords.

1 0

1 page has low text-HTML ratio

About this issue: Your text to HTML ratio indicates the amount of actual text you have on your webpage compared to the amount of code. This issue is triggered when your text to HTML is 10% or less. Search engines have begun focusing on pages that contain more content.

That's why a higher text to HTML ratio means your page has a better chance of getting a good position in search results. Less code increases your page's load speed and also helps your rankings. It also helps search engine robots crawl your website faster.

How to fix: Split your webpage's text content and code into separate files and compare their size. If the size of your code file exceeds the size of the text file, review your page's HTML code and consider optimizing its structure and removing embedded scripts and styles.

1 0

1 page has a low word count

About this issue: This issue is triggered if the number of words on your webpage is less than 200. The amount of text placed on your webpage is a quality signal to search engines. Search engines prefer to provide as much information to users as possible, so pages with longer content tend to be placed higher in search results, as opposed to those with lower word counts.

For more information, please view this video: <https://www.youtube.com/watch?v=w3-obcXkyA4>.

How to fix: Improve your on-page content and be sure to include more than 200 meaningful words.

Sitemap.xml not indicated in robots.txt

About this issue: If you have both a sitemap.xml and a robots.txt file on your website, it is a good practice to place a link to your sitemap.xml in your robots.txt, which will allow search engines to better understand what content they should crawl. How to fix: Specify the location of your sitemap.xml in your robots.txt. To check if Googlebot can index your sitemap.xml file, use the Sitemaps report in Google Search Console: https://search.google.com/search-console/not-verified?original_url=/search-console/sitemaps&original_resource_id.

1 0

include additional data about each URL. Using a sitemap.xml file is quite beneficial. Not only does it provide easier navigation and better visibility to search engines, it also quickly informs search engines about any new or updated content on your website. Therefore, your website will be crawled faster and more intelligently. How to fix: Consider generating a sitemap.xml file if you don't already have one.

Then you should specify the location of your sitemap.xml files in your robots.txt, and check if Googlebot can index your sitemap.xml file with the Sitemaps report in Google Search Console: https://search.google.com/search-console/not-verified?original_url=/search-console/sitemaps&original_resource_id.

1 uncompressed page

About this issue: This issue is triggered if the Content-Encoding entity is not present in the response header. Page compression is essential to the process of optimizing your website. Using uncompressed pages leads to a slower page load time, resulting in a poor user experience and a lower search engine ranking.

How to fix: Enable compression on your webpages for faster load time.

1 0

1 issue with uncompressed JavaScript and CSS file

About this issue: This issue is triggered if compression is not enabled in the HTTP response.

Compressing JavaScript and CSS files significantly reduces their size as well as the overall size of your webpage, thus improving your page load time. Uncompressed JavaScript and CSS files make your page load slower, which negatively affects user experience and may worsen your search engine rankings.

If your webpage uses uncompressed CSS and JS files that are hosted on an external site, you should make sure they do not affect your page's load time. For more information, please see this Google article <https://developers.google.com/web/fundamentals/performance/optimizing-content-efficiency>. How to fix: Enable compression for your JavaScript and CSS files on your server.

If your webpage uses uncompressed CSS and JS files that are hosted on an external site, contact the website owner and ask them to enable compression on their server. If this issue doesn't affect your page load time, simply ignore it.

1 0

1 issue with uncached JavaScript and CSS file

About this issue: This issue is triggered if browser caching is not specified in the response header. Enabling browser caching for JavaScript and CSS files allows browsers to store and reuse these resources without having to download them again when requesting your page. That way the browser will download less data, which will decrease your page load time.

And the less time it takes to load your page, the happier your visitors are. For more information, please see this Google article

<https://developers.google.com/web/fundamentals/performance/optimizing-content-efficiency>.

How to fix: If JavaScript and CSS files are hosted on your website, enable browser caching for them.

If JavaScript and CSS files are hosted on a website that you don't own, contact the website owner and ask them to enable browser caching for them. If this issue doesn't affect your page load time, simply ignore it.
